smigrip vacuum spreader
Load handling made easy

smigrip the vacuum spreader

Moving up with underpressure

Loads are only ever loads when they have to be moved. With the smigrip, you can make light work of heavy loads for smooth handling of large and bulky goods such as steel plates, concrete elements, pipes, etc. using an efficient and proven system.

The principle is quite simple

The smigrip is simply suspended from the load hook of a crane or a hoist unit that you may already have in your factory. Depending on the weight and size, you can use one or more suction pads that can be moved along the smigrip frame to pick up and hold the load. It can then be moved. The smigrip will enable you to make things move

using proven technology and high utility at an attractive price.

smigrip vacuum spreaders are available with a variety of designs, dimensions, load capacities and features. In standard design for loads up to 4 tonnes.

smigrip application examples for plates

Your specialist for vacuum lifters, handling equipment, crane construction kit

If you would like to learn more about the smigrip or one of our other load handling products, then just give us a call. Our team of specialists is always available to provide you with help and advice, planning services and technical data. **Fon: +49 2335 9608-0**

A product demonstration is also possible in SMI's head quarter in Wetter (Ruhr).
